

M-Live

Creator & Live Commerce Integration — A Hypothetical Feature for Myntra

Product Requirements Document (PRD)

Prepared by: Navdeep S Bist

June 2026

Disclaimer: This is an independent, hypothetical product case study exploring how Myntra could deepen creator-led live commerce on its platform. It is a self-initiated PM practice exercise, not affiliated with, endorsed by, or based on internal information from Myntra. All figures, pricing, and roadmaps are illustrative assumptions made for the purpose of this exercise.

1. Overview

Live Creator & Live Commerce Integration (“M-Live”) aims to transform Myntra from a traditional fashion e-commerce platform into an interactive, creator-led fashion discovery ecosystem — moving from “passive viewing” to “interactive style-discovery.”

This feature tightens the “Creator-to-Customer” loop by enabling real-time product interactions, personalized styling AI during streams, and high-velocity in-stream checkout. It allows influencers and brands to host live shows where viewers can purchase featured products without leaving the video player.

The feature will allow:

- Fashion creators, influencers, and stylists to host live sessions
- Users to watch outfit styling demos in real time
- Interaction via chat, polls, and Q&A about fit, fabric, and styling
- Direct purchase of products within the live stream
- Access to exclusive “Live-Only” fashion drops

This aligns with rising content-commerce behaviour seen on platforms like Instagram and live shopping ecosystems emerging on Flipkart. The initiative strengthens Myntra’s positioning as a fashion-first, trend-led platform rather than just a catalogue marketplace.

2. Problem Statement

There is currently a high gap between seeing a product on a livestream and purchasing it. Despite strong brand recall in fashion, Myntra faces a static product listing experience, high return rates (especially in apparel), low buyer confidence in fit and styling, and product discovery that is heavily dependent on discounts. Fashion is inspiration-driven, but Myntra’s current journey is largely search/filter driven — and users often discover trends on social media but purchase elsewhere.

Without live and creator commerce:

- Trend discovery happens outside Myntra
- Conversion remains price-driven rather than inspiration-driven
- Engagement time on the platform is limited
- Brand storytelling is underutilized

3. Goals & Objectives

3.1 Primary Goals

- Increase view-to-purchase conversion rate for live-featured SKUs by 20%
- Increase average watch time per session by 25% through interactive elements
- Reduce return rate in live-purchased apparel by 10%
- Implement a “One-Click Buy” feature within the video format
- Provide a real-time dashboard for creators to manage “Featured Products” spontaneously

- Increase AOV (Average Order Value) through styled outfit bundling
- Drive incremental GMV via creator-led sales

3.2 Success Metrics (KPIs)

- View-to-cart rate
- View-to-purchase conversion rate
- Average watch time
- GMV per live session
- Bundle purchase rate
- Return rate for live commerce orders
- Creator-led GMV contribution %
- Repeat visit rate for live tab

These KPIs are organized into a formal North Star + Guardrail framework in Section 14, since not all of them should move in the same direction simultaneously — e.g. GMV growth and return rate need to be balanced against each other, not optimized independently.

4. Assumptions

- Fashion influencers and stylists are willing to commit to a regular live-streaming schedule in exchange for commission, without requiring large guaranteed minimum payouts upfront
- Myntra's existing seller/brand base is willing to fund sponsored placements and brand-led live events as an incremental marketing spend, not just expect it bundled into existing listing fees
- Users are willing to make full-price (non-discount-driven) purchase decisions during a live stream based on styling confidence and creator trust, addressing the PRD's stated problem that conversion today is largely price-driven
- Live video infrastructure (CDN, adaptive bitrate streaming) can reliably support concurrent viewership at the scale needed for flagship events (e.g. festive live shows) without requiring a full infrastructure rebuild
- AI size-recommendation accuracy is good enough at launch to meaningfully reduce return rates, rather than just being a UI feature with limited real impact on the stated 10% return-rate-reduction goal

5. Out of Scope (V1 / MVP)

- Virtual try-on integration — explicitly deferred to Phase 2 Expansion (Section 16)
- Shoppable short-form fashion reels — deferred to Phase 2 Expansion
- Regional language live streams — deferred to Phase 2 Expansion
- Cross-border designer events — deferred to Phase 2 Expansion
- Paid access / ticketed exclusive fashion previews — explicitly marked as a future phase in the original monetization model
- AI stylist assistant embedded directly in live chat — deferred to Phase 2 Expansion

- Support for the full 500K+ concurrent viewer scale at MVP — MVP targets the closed beta scale (50 influencers, 10 brands) per Section 15, Phase 2; full scale infrastructure is hardened progressively through Phase 3–4

6. Happy Path — End-to-End Flow

The primary, frictionless journey from a viewer's perspective when everything works as intended:

1. User receives a push notification that a followed creator is going live (or browses the Live tab)
2. User taps into the stream; portrait-mode adaptive video begins playing within 2 seconds
3. Creator highlights a specific item; a product overlay appears within 5 seconds, showing price, sizes, and a “Shop the Look” bundle option
4. User taps the floating product card and selects a size, optionally using the AI size recommendation
5. User taps “One-Click Buy”; a simplified checkout overlay appears without navigating away from the stream URL
6. User confirms address and payment; order confirmation appears as a toast notification while the stream continues uninterrupted
7. Order ships via M-Express (24–48 hour delivery) since the item was featured in a live stream
8. User receives a post-stream notification summarizing items purchased and a link to rewatch the replay

This happy path is the baseline against which all edge cases in Section 9 are defined.

7. User Stories & Acceptance Criteria

A. Customer Stories

7.A1 Watch a Live Styling Demo Before Purchasing

As a user, I want to watch a live demo before purchasing a dress so I can make confident decisions — including seeing how it fits on different body types.

Acceptance Criteria

- Given a user opens a live stream, video begins playing within 2 seconds on a stable connection, with automatic fallback to 360p if bandwidth drops (per Section 8.1).
- Given a creator is actively styling a product, the relevant product overlay appears within 5 seconds of the creator tagging/highlighting it.

7.A2 Ask Questions During a Live Stream

As a user, I want to ask questions during a live stream (e.g. about fabric transparency or comfort) and get instant answers.

Acceptance Criteria

- Given a user submits a chat question, it appears in the creator's moderation queue within 2 seconds.
- Given chat volume exceeds a configurable threshold, spam/flood-detection automatically throttles repeated identical messages without blocking the user entirely.

7.A3 One-Click Buy Within the Stream

As a user, I want to buy a full outfit in one click without leaving the live stream.

Acceptance Criteria

- Given a user taps "One-Click Buy" with a saved address and payment method, checkout completes within the stream overlay without a full page navigation.
- Given the selected size/variant goes out of stock between tap and confirmation, the user is shown real-time stock status before payment is charged, not after.

7.A4 Live-Only Discounts and Reminders

As a user, I want exclusive live-only discounts and reminders for upcoming streams from my favourite creators.

Acceptance Criteria

- Given a user follows a creator, a reminder notification is sent 15 minutes before that creator's scheduled stream starts.
- Given a live-only discount is applied, it is automatically void if the user attempts to complete the purchase after the stream has ended (per Edge Case 4, Section 9).

B. Creator Stories

7.B1 Host a Live Session and Tag Products

As a creator, I want to host a live session and tag multiple products in a single look easily.

Acceptance Criteria

- Given a creator searches for a Myntra SKU during a live stream, it can be added to the active product rail within 5 seconds.
- Given a creator tags a product that is out of stock, the system blocks the tag and surfaces an in-stock alternative suggestion instead.

7.B2 Real-Time Analytics and Commission Visibility

As a creator, I want to see analytics (views, comments, orders placed) and my commission in real time.

Acceptance Criteria

- Given a sale occurs during a live stream, the creator's earnings dashboard updates within 30 seconds.
- Given a sale is later returned/refunded, the creator's commission for that order is automatically reversed and clearly flagged in the dashboard (per Edge Case 2, Section 9).

7.B3 Schedule Themed Sessions

As a creator, I want to schedule themed sessions (e.g. Wedding, Summer Trends) and promote upcoming live events.

Acceptance Criteria

- Given a creator schedules a stream, it automatically appears on the Live tab's upcoming schedule and triggers a follower notification at T-15 minutes.
- Given a creator cancels a scheduled stream, all users who set a reminder are notified of the cancellation within 5 minutes.

C. Brand/Seller Stories

7.C1 Collaborate with Creators and Track ROI

As a seller, I want to collaborate with creators to boost sales and see performance reports (GMV, CTR, ROI).

Acceptance Criteria

- Given a sponsored live session ends, a performance report (views, CTR, GMV, ROI) is available to the brand within 24 hours.
- Given a brand sponsors a session that underperforms an agreed minimum-viewership threshold, the brand is notified and offered a make-good session per the sponsorship agreement.

8. Functional Requirements

8.1 Live Streaming Infrastructure

- Video plays in portrait mode with an interactive player supporting 720p/1080p adaptive streaming
- Horizontal, scrollable product rail at the bottom of the stream
- Prominent product overlay when a creator highlights an item, with <5 second latency
- Simplified checkout overlay (address/payment confirmation) that does not navigate away from the stream URL
- Support for 500K+ concurrent viewers at full scale (progressively hardened per the rollout plan in Section 15)
- Recording & replay capability
- Floating product cards with swipe-to-add-to-cart
- "Shop the Look" full outfit bundle
- Size selection within the stream, with AI size-recommendation integration
- Items featured in a live stream are prioritized for M-Express (24–48 hour) delivery
- Adaptive bitrate streaming with automatic fallback to 360p on poor connections (per Section 6 Dependencies)

8.2 Creator Dashboard

- Schedule live streams
- Search and add Myntra SKUs to the stream in real time
- Product tagging interface

- Commission model (fixed % per category)
- Live analytics: views, live chats, polls, live reactions, GMV, conversion rate
- Earnings summary & payouts

8.3 Monetization Model

- Commission-based revenue share on creator-driven sales
- Sponsored live placements (brand-funded)
- Brand-led premium live events
- Exclusive paid-access fashion previews (future phase — see Section 5, Out of Scope)

8.4 Non-Functional Requirements

Category	Requirement
Reliability	99.9% uptime
Trust & Safety	Fraud & bot detection, AI content moderation, compliance with advertising disclosures
Security	Secure payment integration
Data Accuracy	Real-time inventory sync between live stream tags and actual stock
Performance	Product overlay latency < 5 seconds; checkout overlay completes without page navigation
Scalability	Adaptive bitrate streaming with auto-fallback to 360p; CDN-backed delivery to 500K+ concurrent viewers at full scale

9. Edge Cases

Deviations from the happy path (Section 6) that engineering, fraud, and creator-ops teams must explicitly design and test for.

#	Edge Case	Impact	Proposed Solution
1	Product tagged in-stream goes out of stock mid-purchase	Customer charged for an unavailable item, or checkout fails awkwardly	Real-time inventory check at the “One-Click Buy” tap; if stock hits zero before payment confirms, block the purchase and immediately surface an in-stock size/alternative
2	Order placed during a live stream is later returned or cancelled	Creator commission already paid out on a now-reversed sale	Commission is held provisional for the platform’s standard return window before final payout; confirmed returns trigger automatic commission

#	Edge Case	Impact	Proposed Solution
3	Stream quality degrades mid-session (CDN/bandwidth issue)	Viewers drop off, missed sales, poor brand perception during a sponsored event	reversal, clearly flagged on the creator dashboard Adaptive bitrate auto-fallback to 360p (Section 8.1); pre-stream quality testing required for sponsored/flagship sessions (per the original Risk table)
4	User attempts to redeem a “live-only” discount after the stream has ended	Discount abuse, inconsistent pricing, revenue leakage	Live-only discount codes are cryptographically time-bound to the stream’s active window and auto-void on stream end (Story 7.A4)
5	Creator tags a product they are not authorized to sell (wrong brand/seller agreement)	Legal/contractual exposure, seller disputes	Product tagging is restricted to a creator’s pre-approved SKU/brand list, enforced at the tagging interface, not just at payout time
6	Fake/bot engagement inflates view counts or chat activity to game creator payouts or rankings	Fraud, unfair commission payouts, distorted analytics for brands	AI-based fraud detection on engagement patterns (per the original Risk table); flagged sessions are excluded from commission and leaderboard calculations pending review
7	Two creators simultaneously tag the same limited-stock “Live-Only” drop item	Overselling a limited-edition item across concurrent streams	Limited-drop inventory is centrally locked per-unit across all live sessions, not allocated separately per stream
8	User’s payment fails mid-checkout during a high-engagement moment (e.g. flash drop)	Lost sale, user frustration, potential double-charge attempts	Checkout overlay shows a clear retry path without losing the user’s place in the stream; idempotent payment handling prevents double-charging on retry
9	Sponsored brand session underperforms an agreed viewership/GMV threshold	Brand dissatisfaction, disputed sponsorship invoices	Pre-agreed minimum-viewership SLA in the sponsorship contract, with a defined make-good (e.g. bonus placement) if unmet (Story 7.C1)

#	Edge Case	Impact	Proposed Solution
10	Creator's scheduled stream doesn't start on time or is abruptly cut short	Viewer trust erosion, wasted promotion/notification spend	Auto-notification to all reminder-set users on cancellation/no-show (Story 7.B3); repeated no-shows trigger a creator-standing review

10. Dependencies

10.A Technical Dependencies

- Video streaming infrastructure (CDN integration)
- Integration with MAP (Myntra Ad Platform) for creators to boost sessions via sponsored placements
- Adaptive bitrate streaming with auto-fallback to 360p
- AI recommendation engine (styling, size)
- Real-time inventory API updates
- Size recommendation engine
- Payment gateway
- Creator KYC onboarding system
- Community reporting tool (for chat moderation)

10.B Business Dependencies

- Creator acquisition program
- Commission policy definition
- Brand partnership agreements
- Seller education & adoption
- Legal contracts (including authorized-SKU agreements, per Edge Case 5)
- Marketing campaign for launch

11. Risks & Mitigation

Risk	Impact	Mitigation
Low creator adoption	Medium	Higher initial commission + brand collaborations
Poor stream quality	High	Pre-stream quality testing + CDN scaling
Low viewer turnout	High	Influencer pre-promotion + push notifications

Risk	Impact	Mitigation
High return rate	High	Strong size recommendation + live Q&A clarity
Fake engagement	Medium	AI-based fraud detection (Edge Case 6)
Brand resistance	Medium	ROI-based pilot reporting
Commission payout disputes from returns	Medium	Provisional commission holding period before final payout (Edge Case 2)

12. North Star Metric & Guardrails

North Star Metric

Weekly GMV from Completed, Non-Returned Live Commerce Purchases

Defined as GMV from live-stream purchases that remain confirmed (not returned/cancelled) past the standard return window. This is deliberately not just “GMV per live session” or “view-to-purchase conversion,” because both could be inflated by impulsive, low-confidence purchases that are later returned — which would actually work against the PRD’s stated goal of reducing apparel return rates. Tying the North Star to non-returned GMV forces the team to optimize for genuine styling confidence (better size AI, clearer live Q&A), not just raw conversion.

Guardrail Metrics

Metrics that must not degrade while the North Star Metric grows:

Guardrail	Why It’s a Guardrail
Live-commerce return rate	Growth in GMV should not be driven by impulsive purchases that get returned at a higher rate than standard catalogue purchases
Fraud/bot-flagged engagement rate	Creator payouts and rankings should not be inflated by fake engagement (Edge Case 6)
Stream uptime / quality (sub-360p fallback rate)	Scaling concurrent viewership should not come at the cost of degraded video quality for existing viewers
Standard (non-live) catalogue conversion rate	Live commerce should be additive to overall platform GMV, not simply cannibalizing purchases that would have happened via normal search/filter anyway

13. MVP Prioritization

Must Have (MVP / Closed Beta — Phase 2, Section 15)

- Basic live streaming with portrait-mode adaptive video
- Product tagging and the floating product rail
- In-stream cart addition and One-Click Buy checkout

- Creator analytics dashboard (views, GMV, commission)
- Live homepage section
- Real-time inventory sync to prevent overselling (Edge Case 1)

Should Have (Beta Optimization — Phase 3)

- Chat & polls with moderation tooling
- Push notification reminders
- “Shop the Look” bundle
- AI recommendation integration (size, fabric, colour)

Could Have (Public Launch — Phase 4 and beyond)

- Celebrity stylist collaborations
- Sponsored brand showcases at scale
- A/B tested live pricing & placement

Won't Have (V1) — see Section 5, Out of Scope

14. Timeline / Milestones (8-Month Rollout)

Phase	Timeline	Summary
Phase 1: Research & Planning	Month 1–2	Market research, creator interviews, commission framework definition, tech feasibility assessment
Phase 2: MVP Development	Month 3–5	Basic live streaming, product tagging, in-stream cart addition & purchase, creator analytics dashboard, live homepage section. Closed beta with 50 fashion influencers and 10 brands.
Phase 3: Beta Optimization	Month 6	Add chat & polls, push notifications, “Shop the Look” bundle, AI recommendation integration (size, fabric, colour), A/B test live pricing & placement
Phase 4: Public Launch	Month 7–8	Major marketing campaign, brand partnerships, festival fashion live events, celebrity stylist collaborations, sponsored brand showcases

Expected Business Impact (Year 1)

- +4–6% incremental GMV
- 15–20% higher conversion for featured SKUs
- 8–10% reduction in return rate for live purchases
- Strong Gen Z & Tier-2 engagement
- Higher brand partnership revenue
- Higher user lifetime value

15. Phase 2 Expansion (Post-Launch)

- Shoppable short-form fashion reels

- Virtual try-on integration
- AI stylist assistant in live chat
- Regional language live streams
- Cross-border designer events

16. Open Questions

- What is the exact commission split between Myntra, the creator, and the brand/seller for a sponsored session vs. an organic creator-tagged sale?
- Should the provisional commission-holding period (Edge Case 2) match the standard return window exactly, or be shorter to keep creator cash flow healthy?
- How will limited-edition “Live-Only” drop inventory be allocated if demand across simultaneous streams exceeds available stock (beyond the per-unit lock in Edge Case 7)?
- What minimum production-quality bar (lighting, audio, camera) will be required for a creator to qualify for sponsored/featured placement?
- Should regional language live streams (Phase 2 Expansion) launch with dedicated regional creators, or with dubbing/captioning on existing English-language streams?
