

Jio OnePass

Launch Strategy Document

Pricing, Phased Rollout & First 12-Month Launch Strategy

Prepared by: Navdeep S Bist— Product Manager (Practice Case Study)

June 2026

Disclaimer: This is an independent, hypothetical product case study exploring how Reliance Jio could unify loyalty across its consumer ecosystem. It is a self-initiated PM practice exercise, not affiliated with, endorsed by, or based on internal information from Reliance Jio. All figures, pricing, and roadmaps are illustrative assumptions made for the purpose of this exercise.

1. Executive Summary

Jio OnePass is a hypothetical unified loyalty program connecting Jio's telecom base with its commerce, electronics, fashion, and entertainment platforms (JioMart, AJIO, Reliance Digital, JioCinema/JioHotstar) through a single rewards currency and tiered membership.

The target launch user is the existing Jio SIM holder — someone who already trusts and uses Jio for telecom, but has no reason today to consolidate their grocery, fashion, electronics, or entertainment spend within the Jio ecosystem rather than splitting it across Amazon, Flipkart, and standalone OTT subscriptions.

The launch vision for the first 12 months is to prove the core loop — auto-enroll → earn → redeem cross-platform — in two pilot cities with the Lite and Plus tiers only, then expand nationally with the full tier structure (including Max family pooling), without letting cashback liability or fraud erode the program's economics.

2. Pricing Strategy

Pricing for Jio OnePass is already defined in the PRD as a three-tier structure (Section 4) rather than something this document needs to design from scratch. This section focuses on the reasoning behind that structure and how it will be positioned at launch.

2.1 Tier Recap & Positioning

Tier	Price	Positioning at Launch
Lite	Free (auto-enrolled)	"You're already earning — no signup needed." Removes all friction; the entire SIM base is in the funnel from day one.
Plus	₹499–₹699/year	"Your groceries, fashion, and recharge — now paying you back." Targeted at urban, frequent transactors once Lite usage data shows intent.
Max	₹1499–₹1999/year	"One membership for the whole family." Positioned post-pilot, once family-pooling infrastructure and fraud controls are proven (PRD Section 6, Out of Scope for pilot).

2.2 Target Audience & Willingness to Pay

Segment	WTP Driver	Tier Fit
Prepaid, price-sensitive, Tier 2/3	Wants visible savings on recurring telecom spend with zero extra cost	Lite — high volume, zero monetization pressure
Urban frequent shopper/streamer	Already spends across 2+ Jio platforms; wants consolidated cashback + free delivery + OTT	Plus — the primary monetization tier
Family household, multiple SIMs/devices	Manages spend across several family members; wants shared benefits, not 5 separate subscriptions	Max — highest ARPU, highest retention once trust is established

2.3 Benchmarking

Reference	Model	Relevance
Amazon Prime	Single paid tier, broad cross-category benefits (delivery + Prime Video)	Benchmark for “one membership, many benefits” simplicity — but Jio's 3-tier structure is more segmented for a price-sensitive Indian market
Tata NeuPass	Unified points (NeuCoins) across Tata's retail, BigBasket, Croma, Air India, etc.	Closest direct structural comparison — a single currency across a diversified conglomerate ecosystem
Flipkart Plus / Myntra Insider	Free, spend-based tier unlocking delivery and early-access perks	Validates that a free entry tier (like Lite) can drive engagement without upfront monetization

2.4 Justification

The free Lite tier is intentionally the widest funnel possible — auto-enrollment removes the single biggest drop-off point in any loyalty program (the signup step itself). Because Jio already owns the billing relationship via the SIM, Lite carries near-zero acquisition cost. Plus is priced below typical premium memberships (Amazon Prime's India pricing, for comparison) to reflect that it bundles partial rather than full OTT access — deliberately leaving headroom for Max to be the “full bundle” tier. Max's family-pooling mechanic is reserved for national rollout (not pilot) because it is the most operationally complex feature (shared wallets, multi-user consent, churn cascades — PRD Edge Cases 2 and 10) and should only scale once proven on a simpler base.

3. Growth Strategy (Pilot → National → Optimization)

This section reuses the PRD's Phase 0–5 timeline (Section 14) and reframes each phase around growth levers, channels, and metrics.

Phase 0–1: Strategy, Architecture & Design (Month 0–3)

Focus: Internal alignment and technical foundation — no external growth activity yet.

- Secure cross-vertical executive alignment (telecom, JioMart, AJIO, Reliance Digital, JioCinema) on the funding model for cashback liability — this is the single biggest blocker to launch, per the PRD's Business Dependencies
- Finalize the loyalty engine architecture and tier structure so pilot-phase decisions aren't made under time pressure later
- Define pilot success criteria up front (inventory accuracy, fraud rate, enrollment rate) so Phase 3 isn't evaluated against shifting goalposts

Phase 2: Build & Integration (Month 4–7)

Focus: Build the minimum integrations needed for a credible pilot, not the full ecosystem.

- Prioritize MyJio + JioMart + Recharge integration first (Persona 1's happy path, PRD Section 7) — this is the highest-frequency, lowest-complexity loop to prove
- Build the fraud detection engine in parallel with the rewards engine, not after — cashback abuse (PRD Edge Case 3) is cheaper to design against than to retrofit
- Begin offline POS integration only at 1–2 flagship Reliance Digital stores, not network-wide, to de-risk the offline sync edge case (PRD Edge Case 8)

Phase 3: Pilot Launch — 2 Cities, Lite + Plus Only (Month 8)

Focus: Prove the core loop — auto-enroll → earn → redeem cross-platform — at small, controlled scale.

Channels & Growth Levers

- Auto-enrollment is the primary acquisition channel — no separate marketing spend needed to build the Lite base; the channel is the existing SIM relationship itself
- In-app MyJio nudges and SMS at the moment of recharge (Persona 1's happy path) to drive Plus upgrade consideration
- Targeted upgrade offers to users who already show cross-platform behavior (e.g. JioMart + JioCinema usage) — highest-propensity Plus converts
- Tight cohort tracking in 2 cities only, so guardrail metrics (fraud rate, cashback liability %) can be monitored closely before any wider exposure

Target Metrics

- Lite enrollment: ≥ 60% of active SIM base in pilot cities within the pilot window
- Plus conversion: 5–10% of Lite users (conservative, pilot-stage bar)
- North Star check: ≥ 15% of enrolled users transacting on 2+ platforms monthly by end of pilot
- Guardrail check: cashback liability held under an agreed % of pilot-city platform revenue; fraud rate under 1%

Phase 4: National Launch — Full Tier Structure (Month 9–10)

Focus: Scale what pilot data validated, and introduce Max only once the simpler tiers are proven.

Channels & Growth Levers

- National marketing campaign anchored on the pilot's strongest proof point (e.g. “members save X% more across Jio”) rather than a generic feature announcement
- Offline store network-wide POS rollout, using the flagship-store learnings from Phase 2 to avoid repeating early integration mistakes
- Introduce Max tier with family pooling, now backed by fraud and churn-cascade safeguards validated conceptually in the PRD (Edge Cases 2, 10)
- Brand/vertical co-marketing (JioMart, AJIO, Reliance Digital each promoting OnePass within their own app) to reach users who don't primarily engage via MyJio

Target Metrics

- Lite enrollment: $\geq 40\%$ of national active SIM base (PRD Section 3.1 target)
- Plus + Max combined: 15–20% of enrolled users upgraded to a paid tier (PRD Section 3.1 target)
- North Star: $\geq 20\%$ increase in users transacting across 2+ platforms vs. pre-launch baseline

Phase 5: Optimization (Month 11–12)

Focus: Tune the program using real national-scale data rather than continuing to expand blindly.

- Data-led reward-multiplier tuning — identify which campaigns drive genuine cross-platform behavior vs. one-off redemptions
- Tier migration nudges for users sitting just below a status threshold (PRD Story 8.7) to drive Plus→Max upgrades
- Behavioral experimentation on redemption caps and expiry windows to balance member satisfaction against the cashback-liability guardrail
- Renewal-focused campaigns ahead of the 12-month mark, since this is when the first wave of paid-tier subscriptions comes up for renewal

Target Metrics

- ARPU uplift: $\geq 15\%$ for enrolled members vs. non-members (PRD Section 3.1 target)
- Renewal rate: $\geq 70\%$ for paid tiers (PRD Section 3.2 target)
- Guardrails holding steady or improving vs. Phase 3/4 levels, not just North Star growing in isolation

Cross-phase principle: cashback liability and fraud are the binding constraints, not enrollment. Jio already has the distribution (the SIM base); every phase above is sequenced to prove the program's unit economics hold before exposing more revenue to it — culminating in Max (the most generous, most complex tier) only being introduced once Lite and Plus have validated the model nationally.

4. MVP Strategy

4.1 Problem Validation

The PRD's problem framing (ecosystem silos, weak cross-platform recall) is directionally credible given Jio's known multi-platform structure, but it currently rests on competitive observation (Amazon Prime, Tata NeuPass) rather than direct evidence that Jio users specifically want a unified loyalty layer. Before committing to the Phase 2 build, the following lightweight validation is recommended:

- A short survey to existing Jio users (even informally, via personal/family network) on whether they actively use 2+ Jio platforms today, and if not, why not — distinguishing “don't know other Jio platforms exist” from “prefer competitors for specific reasons”
- Desk research into Tata NeuPass's public reception (reviews, news coverage) as the closest real-world analogue, to pressure-test assumptions about cross-conglomerate loyalty adoption in India
- A simple internal model estimating cashback liability at different enrollment/conversion rates, to sanity-check whether the Plus/Max pricing in Section 4 of the PRD can realistically fund the promised benefits before any code is written

4.2 MVP Features & Justification

Feature	Justification
Auto-enrollment into Lite	Zero-friction acquisition using an asset Jio already owns (the SIM relationship); proves the funnel without needing demand generation
Points earning on recharge + JioMart	The single highest-frequency, lowest-integration-complexity loop (Persona 1's happy path) — the fastest way to prove the core mechanic works
Cross-platform redemption (at least 2 platforms)	Without this, the program is just two separate single-platform reward schemes wearing one brand — it must work cross-platform to test the actual hypothesis
Unified wallet ledger	Required for trust; a loyalty program with an opaque balance is worse than no program at all (PRD Story 8.6)
Fraud detection on reward accumulation	Must exist before scale, not after — retrofitting fraud controls after abuse patterns establish is far more costly

Features deliberately excluded from the pilot MVP — Max tier and family pooling, full offline POS network rollout, dynamic personalized offers — are valuable but add the most operational and fraud complexity, and are correctly deferred to national launch per the PRD's Out of Scope section (Section 6).

5. Success Metrics

Metrics are organized in three tiers, consistent with the PRD's North Star and Guardrail framework (Section 13).

L0 — Business-Critical

Metric	Definition	Why It Matters
Active Users Transacting Across 2+ Platforms/Month	North Star Metric — OnePass members transacting on 2+ Jio platforms in a calendar month	Direct proxy for whether the program is solving ecosystem silos, not just issuing points
Cashback Liability as % of Platform Revenue	Total reward cost relative to revenue generated through the program	Guardrail-turned-L0 — the program is not viable if growth outpaces sustainable economics

L1 — Primary Supporting (incl. Guardrails)

Metric	Definition	Target
Lite enrollment rate	% of active SIM base auto-enrolled and engaged	≥ 40% nationally (PRD target)

Metric	Definition	Target
Paid tier conversion rate	% of Lite users upgrading to Plus/Max	15–20% (PRD target)
Fraud/abuse rate (guardrail)	% of wallets flagged for abnormal reward accumulation	< 1%
Paid tier renewal rate	% of Plus/Max subscribers renewing annually	≥ 70% (PRD target)

L2 — Diagnostic

Metric	Definition	Why It Matters
Customer support escalation rate (tier/redemption disputes)	% of members contacting support over points, expiry, or pooling issues	Early warning for trust erosion in the wallet/redemption experience
Single-platform conversion rate (guardrail)	Standard, non-loyalty purchase conversion on each individual platform	Confirms the program is additive, not cannibalizing existing platform performance
