

Local Assured Commerce

Offline Discovery + Online Booking — A Hypothetical Feature for Amazon

Product Requirements Document (PRD)

Prepared by: Navdeep

June 2026

Disclaimer: This is an independent, hypothetical product case study exploring how Amazon could expand into hybrid online-offline commerce. It is a self-initiated PM practice exercise, not affiliated with, endorsed by, or based on internal information from Amazon. All figures, processes, and roadmaps are illustrative assumptions made for the purpose of this exercise.

1. Overview

Amazon has built deep trust in Tier 1 cities through wide selection, competitive pricing, fast delivery, and seamless post-purchase support. In Tier 2 & Tier 3 cities, however — especially for high-value electronics (smartphones, TVs, refrigerators, coolers, washing machines) — customer behaviour differs significantly. When a product is urgently needed, customers often prefer nearby local stores for immediate availability, physical inspection, and perceived ease of post-purchase support.

At the same time, local electronics retailers are losing relevance: limited inventory depth, inability to match organized chains like Croma and Reliance Digital, no digital visibility, and weak ability to compete on Amazon-level pricing, offers, and financing.

This creates a strategic opportunity that goes beyond simple inventory visibility — it is about redefining how online and offline retail coexist in emerging Indian markets.

Product Vision

Build a “Local Assured Commerce” layer inside the Amazon app that digitally connects nearby offline electronics retailers with Amazon customers, combining online discovery & comparison, offline trust & instant fulfilment, and Amazon’s payments, offers & booking security.

Customers will be able to:

- Search for electronics available in nearby verified offline stores
- Compare real-time prices, variants, colour, and offers
- See warranty details and service coverage
- Book instantly using Amazon’s payment stack (card offers, EMI, discounts)
- Reserve the item securely with a booking ID + secure pickup authentication

Local retailers will be able to:

- Get access to Amazon’s customer traffic
- Update inventory in real time
- Receive structured booking notifications
- Reduce walk-in uncertainty
- Compete digitally without building their own tech infrastructure

Strategic Importance

This initiative bridges three critical gaps: the Urgency Gap (customers needing immediate purchase cannot wait for delivery), the Trust Gap (relationship-based buying still dominates for big electronics in smaller cities), and the Selection Gap (local stores cannot stock full catalogue depth like Amazon). By integrating offline inventory visibility within Amazon, the platform moves from being a pure e-commerce marketplace to an omni-channel commerce enabler for Indian markets.

2. Problem Statement

In Tier 2 and Tier 3 cities, customers purchasing high-value electronics exhibit behaviour that differs significantly from metro markets. While Amazon offers wider assortment, competitive pricing, and digital offers, customers often choose local stores for three key reasons: urgency of

purchase, trust & reassurance (physical inspection, easy return for service), and perceived service accessibility (warranty claims, repairs).

Local electronics retailers, meanwhile, face limited inventory depth, inability to match digital payment offers and EMI options, low digital discoverability, declining footfall against organized chains, and no integrated system for real-time inventory or secure digital bookings.

This results in a fragmented experience:

- Customers must physically visit multiple stores to compare prices and variants
- They lose access to structured online discounts and card offers
- Local retailers lose customers who prefer wider selection and pricing transparency
- Amazon loses urgent, high-value purchase opportunities in non-metro markets

There is currently no unified platform that combines real-time offline inventory visibility, online price/offer comparison, secure digital booking with payment, physical inspection before handover, and authentication-backed pickup confirmation.

3. Goals & Objectives

Product Goal

Enable an omni-channel electronics buying experience within Amazon that allows customers in Tier 2 & Tier 3 cities to discover, compare, and securely book products from nearby offline stores — combining the trust of local retail with Amazon's pricing power and digital infrastructure.

Business Goals

- Increase Electronics GMV in Tier 2 & 3 Cities — capture urgent, high-value purchases currently going to local stores
- Improve Conversion for High-Intent, Urgent Searches — reduce drop-offs caused by delivery timelines
- Acquire and Digitize Local Electronics Retailers — onboard verified offline sellers and expand Amazon's supply ecosystem
- Strengthen Competitive Positioning — build a defensible hybrid model against Croma and Reliance Digital
- Increase Trust in High-Value Categories — improve confidence via physical inspection + secure digital booking

Customer Objectives

- Show real-time inventory in nearby stores with same-day pickup option
- Provide transparent comparison of price, offers, variants, colours, and warranty across stores
- Enable secure booking with Amazon card discounts, EMI, and offers, with booking ID + OTP pickup authentication
- Preserve Pre-Delivery Inspection (PDI) before final confirmation
- Clearly display warranty details and service centre coverage

Seller (Local Retailer) Objectives

- Increase footfall via digital discovery inside Amazon app search results
- Enable real-time inventory updates through a simple dashboard
- Receive structured booking notifications with SKU, colour, variant, and booking ID
- Secure handover process via OTP-based confirmation to prevent fraud
- Compete on offers — access Amazon's payment offers, EMI schemes, and financing programs

Strategic Outcome

This initiative aims to transform Amazon from a pure e-commerce marketplace into a hybrid commerce infrastructure layer for Indian markets — not just showing offline inventory, but building a scalable, secure, trust-first omni-channel model that benefits customers, retailers, and Amazon simultaneously.

4. Assumptions

- Local electronics retailers are willing to share real-time inventory data and accept a commission-based or subscription-based partnership with Amazon
- Amazon's existing seller infrastructure (GST verification, business registration) can be extended to local offline retailers with minimal rework
- Customers in Tier 2/3 cities have reliable enough smartphone and internet access to use the in-app discovery and booking flow
- Brands/manufacturers will honour warranty claims for products purchased through this channel, regardless of whether the retailer is a large chain or an independent local store
- Local retailers can realistically fulfil same-day pickup commitments once a booking is confirmed

5. Out of Scope (V1)

- Home delivery from local stores (this feature is pickup-only in V1; delivery may be explored in a later phase)
- Categories outside high-value electronics (e.g. groceries, fashion, furniture) — V1 is scoped to smartphones, TVs, refrigerators, coolers, and washing machines only
- Cross-border or international store partnerships
- Full POS (point-of-sale) system replacement for retailers — the seller dashboard is for booking/inventory only, not a complete retail management system
- Dynamic/algorithmic pricing recommendations for sellers — sellers set their own prices in V1
- Installation or after-sales repair services managed directly through the app

6. Target Users

User Type	Description	Key Needs
Urgent Buyer (Customer)	Tier 2/3 city resident needing an electronics replacement/purchase immediately	Speed, certainty of stock, ability to inspect before paying fully
Value Comparator (Customer)	Customer comparing price/offers before a planned high-value purchase	Transparent comparison across stores, EMI/bank offers
Local Store Owner (Seller)	Independent electronics retailer in a Tier 2/3 city	Increased footfall, simple tools, fair competition against big chains
Amazon Platform Team (Internal)	Category and marketplace teams managing the feature	Reliable inventory data, fraud prevention, GMV growth

7. Happy Path — End-to-End Flow

The primary, frictionless journey a customer and store owner experience when everything works as intended:

1. Customer searches for a product (e.g. “iPhone 15”) in the Amazon app
2. A “Available in Nearby Stores” section appears alongside standard online listings
3. Customer taps “Compare Nearby Stores” and reviews price, variant, colour, warranty, and offers across stores
4. Customer selects the best option and taps “Reserve & Pick Up”
5. Customer completes payment in-app (with applicable card/EMI offers)
6. System generates a Booking ID + unique pickup password and notifies the store owner instantly
7. Store owner prepares the reserved item before the customer arrives
8. Customer visits the store, performs Pre-Delivery Inspection (PDI), and is satisfied
9. Customer shares the pickup password; store owner enters it; system sends an OTP to the customer
10. Customer shares the OTP; store owner confirms; order status updates to “Delivered”

This happy path is the baseline against which all edge cases in Section 11 are defined — each edge case represents a deviation from one of these steps.

8. User Stories & Acceptance Criteria

8.1 Customer — Discover Nearby Store Inventory

As a customer looking to buy an electronics product urgently, I want to see whether the product is available in nearby stores so that I can get it immediately instead of waiting for delivery.

Use Case Flow

- Customer searches for a product (e.g. smartphone, TV, refrigerator)

- A new section appears: “Available in Nearby Stores”, showing store name, distance, price, variant/colour, offers, and pickup availability

Acceptance Criteria

- Given a product search with at least one verified store within 15 km, the “Available in Nearby Stores” section loads within 2 seconds.
- Given no nearby store has the product, the section is hidden entirely rather than showing an empty state.
- Given the customer has not granted location access, the system prompts for manual location entry instead of failing silently.

8.2 Customer — Compare Prices and Offers Across Stores

As a customer, I want to compare prices, offers, colours, and variants across nearby stores so that I can choose the best deal available.

Use Case Flow

- Customer taps “Compare Nearby Stores”
- System displays multiple stores with price, variant, colour, warranty, and bank/EMI offers
- Customer can sort by lowest price, closest store, or best offer

Acceptance Criteria

- Given 2+ stores carry the product, results are sortable by price, distance, and offer value.
- Given store prices differ from the online Amazon listing, the difference is clearly labelled (not hidden).

8.3 Customer — Book Product from Store

As a customer, I want to reserve the product online so that the item is guaranteed when I reach the store.

Use Case Flow

- Customer selects a store and taps “Reserve & Pick Up”
- System shows final price with card discounts and EMI options
- Customer completes payment in-app

Acceptance Criteria

- Given payment succeeds, the selected store’s inventory for that exact SKU/variant is decremented and locked within 5 seconds.
- Given two customers attempt to reserve the last unit at the same time, only one booking succeeds; the other sees “Just reserved by another customer” and is shown the next nearest store.
- Given payment fails after the amount is deducted, the system auto-reverses the charge within 24 hours and does not create a booking.

8.4 Customer — Receive Booking Confirmation

As a customer, I want a secure booking confirmation so that I can easily and safely collect the product from the store.

Use Case Flow

- After payment, customer receives Booking ID, unique pickup password, store address, and pickup validity window
- Booking appears under “Your Orders” with push + SMS confirmation

Acceptance Criteria

- Given a booking is confirmed, the Booking ID and pickup password are generated and delivered (push + SMS) within 5 seconds of payment.
- Given the pickup validity window expires without a visit, the booking auto-cancels and inventory is released (see Section 11, Edge Case 5).

8.5 Customer — Store Visit & Product Inspection (PDI)

As a customer, I want to inspect the product before taking delivery so that I am confident about the purchase and can avoid defects or wrong items.

Use Case Flow

- Customer visits the store and shows the Booking ID
- Store owner presents the reserved product
- Customer checks condition, verifies model/colour/variant, and confirms accessories

Acceptance Criteria

- Given the product fails inspection (wrong variant, damage), the customer can decline without losing the right to a refund (see Edge Case 2).
- Given inspection passes, the customer proceeds directly to the secure delivery confirmation flow (Story 8.6) without re-entering payment details.

8.6 Store Owner — Secure Delivery Confirmation

As a store owner, I want a secure way to confirm delivery so that fraudulent or mismatched pickups are prevented.

Use Case Flow

- Customer shares the unique pickup password with the store owner
- Store owner enters the password in the seller system
- System sends an OTP to the customer; customer shares it; store owner enters it to confirm delivery

Acceptance Criteria

- Given the password entered does not match the booking, the system blocks confirmation and logs the failed attempt.
- Given both password and OTP are verified, order status updates to “Delivered” within 5 seconds and cannot be reopened by the store owner without admin override.

8.7 Store Owner — Manage Inventory & Receive Booking Notifications

As a store owner, I want to update my inventory in real time and get instant booking notifications, so that customers see accurate availability and I can prepare for pickup.

Use Case Flow

- Store owner logs into the Amazon Seller dashboard and updates model, colour, storage variant, price, and stock quantity

- On a new booking, the store owner receives Order ID, product details, variant/colour, and pickup time window; inventory auto-marks as “Reserved”

Acceptance Criteria

- Given a store owner updates stock to zero, the listing disappears from customer search results within 30 seconds.
- Given a new booking is made, the store owner is notified within 5 seconds via the seller dashboard and push notification.

8.8 Customer — Cancel Booking & Receive Refund

As a customer, I want to cancel my booking (before visiting the store, or after an unsatisfactory inspection) and receive a refund, so that I am not forced into a purchase that no longer fits my needs.

Use Case Flow

- Customer opens “Your Orders,” selects the booking, and taps “Cancel Booking”
- System shows the cancellation policy and refund amount
- On confirmation, the store owner is notified and inventory is released; refund is auto-initiated

Acceptance Criteria

- Given cancellation occurs before the store visit, a full refund is initiated automatically within the same session.
- Given cancellation occurs after a failed PDI, the customer is not charged any cancellation fee.
- Given a refund is initiated, it is processed to the original payment method within 3–5 business days and is trackable in-app.

8.9 Customer — Post-Purchase Support

As a customer, I want to know where to go if I face issues with the product after purchase.

Use Case Flow

- Purchase details remain in order history with warranty info, manufacturer service centres, and store contact details

Acceptance Criteria

- Given an order is marked “Delivered,” warranty and service-centre information is visible in order details within the same session, with no additional lookup required.

9. Edge Cases

Consolidated list of deviations from the happy path (Section 7) that engineering and QA must explicitly design and test for.

#	Edge Case	Impact	Proposed Solution
1	Product shown as available but store has zero/wrong stock at	Customer frustration, lost trust, failed pickup	Store owner flags Unavailable/Mismatch in-app; customer is offered an alternative product, another

#	Edge Case	Impact	Proposed Solution
2	pickup time (inventory mismatch) Customer fails PDI and is not satisfied with the product condition or variant	Risk of forced purchase, disputes	nearby store, or a full refund (Section 8.8) Customer can decline at PDI stage with no cancellation fee; store owner marks booking Cancelled; full refund auto-initiated
3	Payment deducted but booking not created (gateway timeout)	Customer loses money with no booking	Auto-reconciliation job; full auto-refund within 24 hours if no booking record exists
4	Two customers attempt to reserve the last unit simultaneously	Double-booking, only one can be honoured	Inventory lock at payment-intent stage; atomic transaction at confirmation; losing customer is shown next nearest alternative
5	Customer never visits the store after booking (no-show)	Inventory blocked, lost sales for retailer	Pickup validity window (e.g. 24 hours); auto-release of inventory and reminder notifications before expiry
6	Store owner refuses to honour the price/offer shown in-app at pickup	Customer complaint, platform credibility damage	Booking receipt locks in price at time of reservation; repeated retailer violations trigger penalties or delisting
7	Store owner enters a wrong OTP/password repeatedly (fraud attempt or genuine error)	Risk of fraudulent pickup or legitimate customer blocked	Limit failed attempts (e.g. 3) before requiring admin/support intervention; all attempts logged for fraud monitoring
8	Store owner has poor digital literacy and fails to update inventory regularly	Inventory inaccuracy, customer trust erosion	Simple mobile-first dashboard, regional onboarding/training support, automated stale-inventory alerts to sellers
9	Customer requests a product variant/colour not actually offered at that store (data entry error by seller)	Wasted trip, customer dissatisfaction	Mandatory structured variant/colour fields in seller dashboard (no free text); periodic spot-check audits of high-traffic listings
10	Network/connectivity issue at the store during OTP verification	Pickup gets stuck mid-flow	Offline-tolerant confirmation: password-only confirmation with deferred OTP sync once connectivity restores, flagged for review

10. Product Requirements

10.A Functional Requirements — Customer-Side

Nearby Store Product Discovery

- Show online delivery options + nearby store availability section on every relevant product search
- Display store name, distance, price, available variants, colour, estimated pickup time, and store rating
- Auto-detect user location or allow manual selection

Store Comparison

- “Compare Stores” view across price, variants, colour, warranty, EMI/bank offers, and distance
- Sort by lowest price, nearest store, best offer, or highest rated store

Reservation, Confirmation & Pickup

- Reserve & Pick Up flow with final price (incl. discounts/EMI) shown before payment
- Generate Booking ID + unique pickup password + store address + pickup validity window on confirmation
- Pre-Delivery Inspection (PDI) step before final handover
- OTP-based secure delivery confirmation (Section 8.6)

10.B Functional Requirements — Seller (Store Owner) Side

- Seller onboarding via Amazon seller platform with business license, GST, location, and brand-authorization verification
- Real-time inventory dashboard: product listing, price, variant, colour, stock quantity, offer participation
- Instant booking notifications with Order ID, product, variant, colour, and pickup window
- Pickup verification tools: Booking ID lookup, password entry, OTP entry, delivery confirmation

10.C Admin / Platform Features

- Store discovery algorithm factoring distance, availability, ratings, and pricing competitiveness
- Offer integration: bank discounts, EMI/no-cost EMI, platform promotions
- Order tracking with statuses: Reserved, Ready for Pickup, Picked Up, Cancelled

10.D Non-Functional Requirements

Category	Requirement
Performance	Search results load within 2s; inventory sync within 30s; booking confirmation within 5s of payment

Category	Requirement
Scalability	Support thousands of stores and millions of customers; pilot capacity: 10,000 stores, 500,000 daily searches
Reliability	99.9% uptime; inventory conflicts in <0.5% of bookings
Security	OTP-based pickup verification, encrypted payment processing, fraud detection for suspicious bookings
Data Accuracy	Inventory accuracy target $\geq 90\%$; real-time sync between seller dashboard and customer app
Usability	Simple seller dashboard UI; clear booking instructions; easy comparison interface
Compliance	GST regulations, consumer protection rules, electronics warranty policies
Availability	Android app, iOS app, and Amazon web version

11. Dependencies

Dependency	Why It Matters
Seller onboarding & retailer partnerships	Without strong retailer participation, customers see limited store options, reducing feature value
Real-time inventory management system	Inventory accuracy is critical to customer trust and avoiding cancellations
Location services (GPS/maps API)	Incorrect store discovery negatively impacts user experience
Amazon payment infrastructure	Customers expect the same payment benefits as standard online purchases
Offer & promotion integration	Competitive pricing is key when comparing local stores to large chains
Seller dashboard & inventory tools	Sellers with limited tech literacy need simple, reliable tools to maintain accuracy
Store onboarding & training processes	Ensures smooth execution, reduces operational errors, improves trust
Secure pickup verification infrastructure	Prevents fraud and unauthorized pickups
Notification infrastructure (push/SMS/email)	Ensures timely coordination between customers and store owners
Customer support integration	Customers expect the same support experience as standard Amazon orders

Dependency	Why It Matters
Brand/manufacturer warranty partnerships	Warranty trust is essential for high-value electronics purchases

12. Risks & Mitigation

Risk	Impact	Mitigation
Inventory mismatch (stale seller data)	Customer frustration, cancellations, lost trust	Real-time sync, auto-block bookings at zero stock, accuracy monitoring, penalties for repeated inaccuracies
Low store-owner technology adoption	Incorrect listings, delayed updates, low participation	Simple mobile-first dashboard, training programs, regional seller support teams
Price conflicts between online and offline channels	Customer confusion, perceived lack of transparency	Clearly labelled store-specific pricing; price-lock at booking confirmation
Booking fraud / unauthorized pickup	Product theft, financial loss, disputes	Multi-layer authentication (Booking ID + password + OTP), full pickup logs
Customer no-show after booking	Inventory blocked, lost sales for retailer	24-hour pickup validity window with auto-release and reminders
Retailer non-compliance with shown price/offers	Customer complaints, platform credibility damage	Clear seller agreements, complaint monitoring, penalties/delisting for repeat violations
Operational disputes during PDI	Customer dissatisfaction, refund requests, escalations	PDI guidelines, sealed-product requirement, digital order records for dispute resolution
Scalability challenges as store network grows	Slow search, delayed updates, poor app performance	Scalable infra, optimized location-based search, distributed inventory systems
Brand warranty uncertainty	Reduced adoption for high-value purchases	Clear warranty display, partnerships with authorized retailers, links to official service centres
Competition from organized chains (Croma, Reliance Digital)	Market share pressure	Wider local store network, Amazon payment/EMI advantages, superior comparison tooling

13. Success Metrics

North Star Metric

Weekly Completed Pickups from Verified Nearby Stores

Defined as the number of bookings per week that reach “Delivered” status via successful OTP-confirmed pickup. This captures the full value chain — discovery, comparison, booking, and a trustworthy physical handover — rather than just bookings made, which could be inflated by no-shows or cancellations. It directly reflects whether the feature is solving the urgency + trust problem stated in Section 2.

Guardrail Metrics

Metrics that must not degrade while the North Star Metric grows — protecting against optimizing the wrong thing:

Guardrail	Why It's a Guardrail
Inventory accuracy rate (target $\geq 90\%$)	Growth in bookings should not come at the cost of overselling or showing stale stock
Booking-to-pickup fraud/dispute rate (target $< 0.5\%$)	Faster booking flows should not increase fraudulent or disputed pickups
Standard online conversion rate (unaffected)	This feature should not cannibalize or degrade Amazon's core online delivery conversion for the same categories
Customer Support escalation rate for this flow (target $< 3\%$ of bookings)	Scaling store partnerships should not overwhelm support with booking/refund disputes

Supporting Success Metrics (12-Month Horizon)

Customer Metrics

- +15–20% increase in electronics conversion in Tier 2/3 cities
- $\geq 25\%$ of urgent search queries show local store results
- $\geq 40\%$ pickup completion rate post-booking
- NPS improvement in high-value electronics category

Seller Metrics

- Onboard 5,000+ verified local electronics retailers in pilot states
- $\geq 90\%$ booking fulfilment rate

Business Metrics

- Incremental GMV contribution from offline-assisted sales
- Reduction in delivery-related cancellations for urgent purchases
- Increase in repeat purchase rate from local-assisted customers

14. MVP Prioritization

Must Have (V1 / Pilot)

- Nearby store discovery + comparison view

- Reservation & in-app payment with inventory lock
- Booking ID + pickup password + OTP-based secure delivery confirmation
- Basic seller dashboard: inventory, pricing, booking notifications
- Cancellation & refund flow (pre-visit and post-PDI)
- Unavailability/mismatch handling at pickup (Edge Case 1)

Should Have (Fast-follow, Phase 4–5)

- Automated stale-inventory alerts to sellers
- Store ratings influencing discovery ranking
- Multi-category expansion beyond core electronics list

Could Have (Later)

- Home delivery option from local stores
- Dynamic pricing recommendations for sellers
- In-app dispute resolution chat between customer and store

Won't Have (V1) — see Section 5, Out of Scope

15. Timeline / Milestones

Phase	Timeline	Summary
Phase 1: Research & Product Planning	Month 1–2	Validate the problem with customers and retailers; define scope and technical architecture. Deliverables: finalized PRD, design mockups, technical architecture plan, pilot market selection.
Phase 2: Product Design & Development	Month 3–5	Build customer app features (discovery, comparison, reservation, confirmation), seller dashboard, payment/offer integration, and the security/verification system.
Phase 3: Pilot Launch	Month 6–7	Test in select Tier 2 cities (e.g. Haldwani, Lucknow, Jaipur, Indore). Onboard 100–200 verified retailers; beta test with a limited customer group; monitor inventory accuracy, booking success, and satisfaction.
Phase 4: Feature Optimization	Month 8–9	Improve UX based on pilot feedback, add automated inventory-accuracy alerts, introduce retailer training systems, optimize location-based search performance.
Phase 5: Regional Expansion	Month 10–11	Onboard thousands of additional retailers; expand categories (laptops, ACs, washing machines); run local marketing campaigns.
Phase 6: Nationwide Rollout	Month 12	Full launch across India; target 5,000+ onboarded retailers; customer awareness campaign highlighting same-day pickup and secure booking.

16. Open Questions

- What commission or fee structure will Amazon charge local retailers for participating in this program?
- How will Amazon verify product authenticity at independent local stores to protect brand/warranty trust?
- Should the pickup validity window vary by product category (e.g. shorter for high-demand smartphones, longer for appliances)?
- What is the dispute-resolution SLA if a customer and store owner disagree during PDI?
- Will this feature eventually support home delivery from local stores, and if so, on what timeline?
